Pontotoc Ridge-Flatwoods Experiment Station; North Mississippi Research and Extension Center; Mississippi State University; Pontotoc, MS 38863

ABSTRACT: A corn herbicide trial was established to evaluate broadleaf signalgrass (*Brachiaria platyphylla*) and pigweed (*Amaranthus sp.*) control systems in a no-tillage environment. Weed control systems included preemergence (PRE) and postemergence (POST) herbicides applied alone, sequentially, and as tank-mix partners at different timings. At 155 DAP (days after planting), all herbicide systems with a PRE followed-by (fb) POST application, sequential Roundup WEATHERMAX (glyphosate) applications, or Roundup WEATHERMAX plus residual herbicide tank-mix controlled broadleaf signalgrass at least 94%. Pigweed was controlled at 100% for all treatments except for a single application of Roundup WEATHERMAX. The addition of a residual herbicide (PRE OR POST) or a sequential application of Roundup WEATHERMAX improved weed control compared to a single application of Roundup WEATHERMAX. Yield with all herbicide treatments was at least 195 bu/ac and higher than the untreated checks of Dekalb 69-71 RR/YG and Pioneer 31B13 YG, which yielded 175 and 172 bu/ac, respectively. The highest yielding treatment was Pioneer 31B13 YG with a standard herbicide treatment of 1.8 qt/ac Bicep II Magnum plus 0.6 qt/ac Atrazine fb 0.66 oz/ac Accent, which yielded 216 bu/ac. This was not different compared to the same treatment applied to Dekalb 69-71 RR/YG. There were no differences in yield among herbicide treatments applied to the Dekalb 69-71 RR/YG corn hybrid. Grain yield with the addition of a residual herbicide or a sequential application of Roundup WEATHERMAX was not different compared to a single application of Roundup WEATHERMAX.

CITATION: Shankle, M.W., T.F. Garrett and J.L. Main. 2005. Herbicide systems in no-tillage corn. Annual Report 2004 of the North Mississippi Research & Extension Center. Mississippi Agriculture & Forestry Experiment Station Information Bulletin 419:49-54.

KEYWORDS: broadleaf signalgrass, pigweed, corn, no-tillage

MATERIALS AND METHODS: A herbicide study was conducted in 2004 to evaluate broadleaf signalgrass and pigweed in no-tillage corn at the Pontotoc Ridge-Flatwoods Experiment Station. The soil type was a Bude silt loam (fine-silty, mixed, thermic Glossaquic Fragiudalfs). The experimental design was a randomized complete block with 4 replications. Plot size was 10 x 40 ft. Fertilizer and lime were applied in the spring according to Mississippi State Soil Testing Laboratory recommendations.

Dekalb 6971 RR/YG and Pioneer 31B13 YG hybrids were planted no-tillage in 30-in rows on April 5 with a seeding rate of 32,000 seed/ac. A side-dress application of 180 lb N/ac (32% UAN solution) was applied 6-in from row and 2-in deep at the 6 to 8 leaf stage. A preplant burndown application of 21.4 oz/ac Roundup WEATHERMAX (glyphosate) was applied to the

entire trial area 2 weeks before planting. An application of 8.7 lb/ac Lorsban 15G (chlorpyrifos) was T-banded at planting. Herbicide treatment application timings were preemergence (PRE), 36 days after planting (DAP) and 57 DAP. All treatments were applied with a tractor-mounted CO₂ sprayer. Weed control ratings were conducted at 36, 43, 50, 57, 65, 71, 78 DAP, and pre harvest. Only ratings made at 36, 50, 71, and 155 DAP are discussed in this report.

Corn and weed heights for early postemergence applications (E-POST) were 10 inches and 2 to 4 inches, respectively. Late postemergence (L-POST) applications were made at less than 2 inch weeds and 35 inch corn. Herbicide systems included a tank-mixture of 1.8 qt/ac Bicep II Magnum (metolachlor + atrazine) plus 0.6 qt/ac Atrazine PRE fb 0.66 oz/ac fb Accent (nicosulfuron) plus 1 % v/v crop oil concentrate (COC) L-POST; a tank-mixture of 1.8 qt/ac Bicep II Magnum plus 0.6 qt/ac Atrazine PRE; 0.9 qt/ac Bicep II Magnum plus 0.3 qt/ac Atrazine PRE fb 16 oz/ac Roundup WEATHERMAX E-POST; a tank-mixture of 1.5 qt/ac Atrazine plus 21.4 oz/ac Roundup WEATHERMAX E-POST; a tank-mixture of 1.5 qt/ac Atrazine plus 21.4 oz/ac Roundup WEATHERMAX E-POST fb 16 oz/ac Roundup WEATHERMAX L-POST; 21.4 oz/ac Roundup WEATHERMAX E-POST; 21.4 oz/ac Roundup WEATHERMAX E-POST fb 16 oz/ac Roundup WEATHERMAX L-POST; 1.3 pt/ac Cinch ATZ (metolachlor + atrazine) PRE fb a tank-mixture of 0.75 oz/ac Steadfast (nicosulfuron + rimsulfuron), 2.0 qt/ac Atrazine 4 SC, 2 lb/ac ammonium sulfate, and 1 % v/v COC E-POST; 0.8 pt/ac Cinch (metolachlor) PRE fb a tank-mixture of 0.75 oz/ac Steadfast, 2.0 qt/ac Atrazine 4 SC, 2 lb/ac ammonium sulfate, and 1 % v/v COC E-POST; 2.5 pt/ac Atrazine 4 SC PRE fb a tank-mixture of 0.75 oz/ac Steadfast, 2.5 pt/ac Atrazine 4 SC, 2 lb/ac ammonium sulfate, and 1 % v/v COC E-POST; a tank-mixture of 0.75 oz/ac Steadfast, 2.0 qt/ac Atrazine 4 SC, 2 lb/ac ammonium sulfate, and 1 % v/v COC E-POST; a tank-mixture of 0.75 oz/ac Steadfast, 2.0 pt/ac Cinch ATZ (metolachlor + atrazine), 2 lb/ac ammonium sulfate, and 1 % v/v COC E-POST; 1.2 qt/ac Bicep II Magnum plus 0.4 qt/ac Atrazine PRE fb 21.4 oz/ac Roundup WEATHERMAX E-POST; 0.9 qt/ac Bicep II Magnum plus 0.3 qt/ac Atrazine PRE fb 21.4 oz/ac Roundup WEATHERMAX E-POST; a tank-mixture of 0.75 oz/ac Steadfast, 2 oz/ac Callisto (mesotrione), 1.5 qt/ac Atrazine 4 SC, 2 lb/ac ammonium sulfate, and 1 % v/v COC E-POST; a tank-mixture of 0.66 oz/ac Steadfast, 3.0 oz/ac Callisto, and 1 % v/v COC E-POST; 3.0 qt/ac Lexar (metolachlor + atrazine + mesotrione) applied PRE. The two center rows of each plot were mechanically harvested on September 10 with a plot combine equipped with a corn header. Corn grain from each plot was weighed and seed moisture was determined using a MT3 Farmex® grain moisture tester. Yield was adjusted to 15.5% moisture. Analysis of variance was conducted and means were separated using Fisher's protected LSD ($\alpha=0.05$).

RESULTS AND DISCUSSION: This research was conducted to evaluate broadleaf signalgrass and pigweed control in a no-tillage environment. Insect and weed pressure was minimal and environmental growing conditions were good for corn production in 2004. Rainfall during the growing season was 4.10, 9.77, 9.03, 4.61, 3.45, and 0.28 inches for April, May, June, July, August, and until harvest on September 7, respectively.

The treatment of 1.8 qt/ac Bicep II Magnum plus 0.6 qt/ac Atrazine fb 0.66 oz/ac Accent was included to represent a standard herbicide system approach. This system was applied to Dekalb 69-71 RR/YG and Pioneer 31B13 YG to compare crop performance of a glyphosate tolerant hybrid to a conventional hybrid. Each hybrid received the same treatments and weed control was

not different throughout the growing season. At 36 DAP only PRE applications had been applied. At 50 DAP all treatments had been applied for at least 14 days, except for two sequential Roundup WEATHERMAX applications and an Accent application which followed a PRE treatment of 1.8 qt/ac Bicep II Magnum plus 0.6 qt/ac Atrazine to be applied at 57 DAP

At 50 DAP all herbicide systems controlled broadleaf signalgrass at least 95% except for an E-POST treatment of 0.75 oz/ac Steadfast, 2.0 pt/ac Cinch ATZ, 2 lb/ac ammonium sulfate + 1 % v/v COC and an E-POST treatment of 0.66 oz/ac Steadfast + 3.0 oz/ac Callisto + 1 % v/v COC, which had a control of 89 and 91%, respectively. Pigweed control at this time was at least 99% for all treatments except for the E-POST treatment of 0.66 oz/ac Steadfast, 3.0 oz/ac Callisto, and 1 % v/v COC, which had control of 91% (Table 1).

At 155 DAP (harvest) all herbicide systems containing a PRE fb E-POST application, a sequential Roundup WEATHERMAX application, or a Roundup WEATHERMAX plus a residual herbicide application controlled broadleaf signalgrass at least 94%. Pigweed was controlled at 100% for all treatments except for a single application of Roundup WEATHERMAX. The addition of a residual herbicide (PRE OR POST) or a sequential application of Roundup WEATHERMAX improved weed control compared to a single application of Roundup WEATHERMAX.

All herbicide treatments yielded at least 195 bu/ac and was higher than the untreated checks of Dekalb 69-71 RR/YG and Pioneer 31B13 YG, which yielded 175 and 172 bu/ac, respectively. The highest yielding treatment was Pioneer 31B13 YG with the standard herbicide treatment of 1.8 qt/ac Bicep II Magnum plus 0.6 qt/ac Atrazine fb 0.66 oz/ac Accent, which yielded 216 bu/ac. This was not different compared to the same treatment applied to Dekalb 69-71 RR/YG. There were no differences among herbicide treatments applied to corn variety Dekalb 69-71 RR/YG. Grain yield with the addition of a residual herbicide or a sequential application of Roundup WEATHERMAX was not different compared to a single application of Roundup WEATHERMAX. Therefore, preliminary research indicates that grain yield with a single or sequential application of Roundup WEATHERMAX can be equivalent to a conventional PRE or POST herbicide system in Roundup Ready corn production.
